

FERROUS SLAG QUALITY CONTROL ASSOCIATION

The Gütegemeinschaft Eisenhüttenschlacken e.V. (Ferrous Slag Quality Control Association) ensures the high quality of products made from ferrous slag. Its members – steelworks, cement plants and materials treatment companies – undertake to comply with strict standards and controls in terms of the technological properties and water resource safety of their products.

To this end, they have developed quality and testing regulations together with the RAL German Institute for Quality Assurance and Labelling. Aggregates and construction material mixtures whose quality is assured are labelled with the ferrous slag quality symbol.

An important element of the quality assurance process consists of regular inspections by neutral, recognised testing bodies. Contracting organisations and the construction companies benefit equally from these additional quality controls. This additional monitoring system makes incoming construction material testing superfluous.
